GUARANTEED QUALITY AND RELIABILITY FROM AUSTRIA

For almost sixty years Froling has specialised in the efficient use of wood as a source of energy. Today the name Froling stands for modern biomass heating technology. Our firewood, wood chip and pellet boilers are successfully in operation all over Europe. All of our products are manufactured in our factories in Austria and Germany. Froling's extensive service network ensures that we can handle all enquiries quickly.

- Excellent environmental compatibility
- Environmentally responsible energy efficiency
- Ideal for all types of house
- More convenience for you
- Sophisticated fully automatic operation
- International pioneer in technology and design.

FLEXIBLE APPLICATIONS

Froling tank systems are best used in combination with a pellet or wood chip boiler, but they can also be used with other heat sources such as an oil or gas boiler. An efficient solar panel system can also be integrated into solar layered tanks, the H3 hygienic solar layered tank and the FW modular solar layered tank. The solar power always takes priority thanks to the Froling Lambdatronic intelligent boiler controller management.

NEW TANK SYSTEMS

Froling tank systems with sensor strip

Froling layered tanks have a terminal strip for optimal positioning of the sensors. This allows multiple sensors to be positioned at any height and moved without having to empty the tank. The labelling of the sensor strip and corresponding Froling connection diagrams makes the sensors extremely easy to position and offer lots of different options. The tank systems are also ideal for combining with other energy systems.

Correct positioning of the sensors on the terminal strip is crucial for optimal operation of the system!

Adjustable feet

Layer separating module

The layer separating module (with electronic controller) can help you achieve maximum efficiency with your solar panel system. Depending on the solar water temperature, the module automatically switches between the top and bottom half of the storage tank. At a high temperature layering takes place in the top half of the storage tank, and at a low temperature layering takes place in the bottom.

The fitting assembly consists of two high efficiency pumps, one heat exchanger and one three-way switch valve. The solar panel circuit is protected against overpressure by an integrated safety group. The fittings of the heat exchanger system are fully assembled on a base plate and tested for leak-tightness. The assembly is fully insulated.

Solar station

The ideal addition to Froling tank systems with solar integration for optimal use of solar energy. The high efficiency pump comes together with bleeder and safety group as a complete, preassembled unit for the solar panel circuit.

SIZE AND FUNCTION

The use of a storage tank, particularly in combination with a firewood boiler, is advantageous as it results in longer refilling intervals, a longer life, reduced fuel consumption and lower emissions. The required size of the storage tank depends on many factors, so we recommend that an expert carry out the calculations for you. The use of a storage tank in combination with a pellet or wood chip system is not essential, but it is recommended as it also offers many advantages such as a reduction in burner starts, longer system life and lower emissions.

NEW: Neopor and fleece insulation

The new Froling tank insulation consists of 80 mm Neopor and 20 mm fleece, resulting in a layer of 100 mm.

Overview of insulation thermoconductivities [W/(m·K)]

Neopor® is the latest version of the insulating material Styropor®. The foam polystyrene contains graphite particles which reduce the thermal radiation and therefore heat loss.

Its thermoconductivity of approx. 0.032 W/(m·K) performs up to 20 percent more effectively than conventional insulation, resulting in around 20% less heat loss (improved energy yield W/(m·K) 0.032 0.033 0.034 0.035 0.036 0.037 0.038).

The following rule of thumb can be used to make a rough estimate of the storage tank volume:

Firewood boiler

Recommended storage tank capacity: approx. 55 - 100 l / kW*

Pellet / wood chip systems

Recommended storage tank capacity: approx. 25 - 35 l / kW*

* Local laws, standards and regulations must also be taken into account when calculating storage tank capacities. Find out more about current legislation in your region at www.froeling.com.

EXACT TEMPERATURE LAYERING IN THE TANK

Precise temperature layering in the tank is crucial for optimal functioning, as it ensures that as much energy as possible can be reused. All Froeling layered tanks feature a special layer separator developed for this purpose.

Mixing/poor energy yield

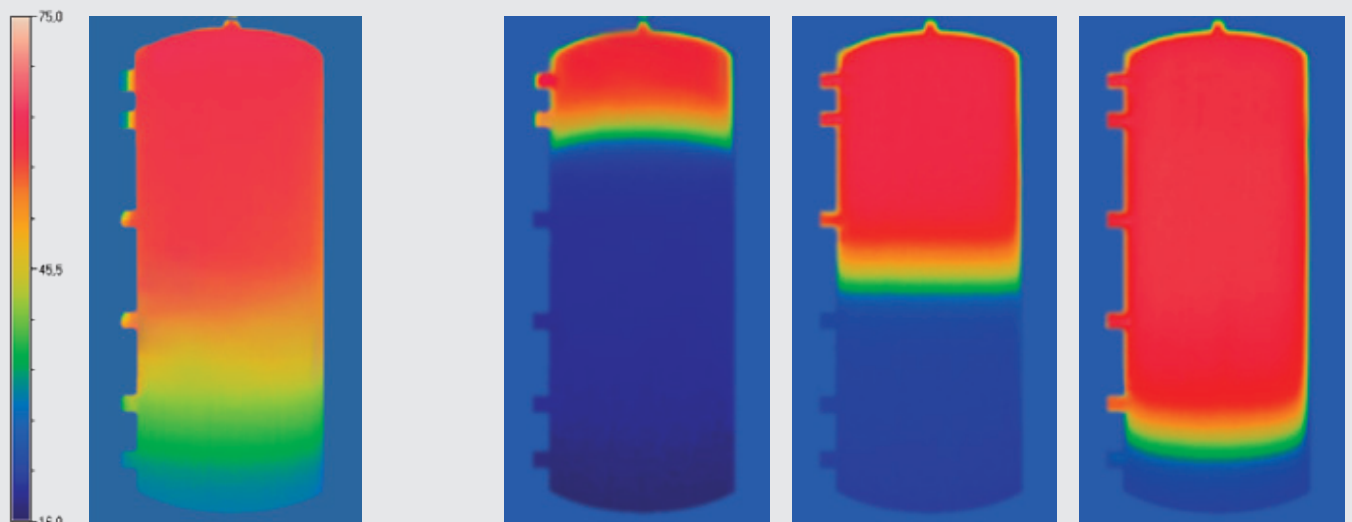

Temperature layering using
layer separator

Incoming water (e.g. return) moves up through the layer separator and is then stored in the area where the water has a similar temperature. This ensures that there is an area with constant hot water.

Furthermore, the specially developed layer separator allows exact temperature layering and guarantees maximum energy yield and low running costs.

Comparison of hot water storage systems

Storage tank without layer separator

Froeling layered tank with layer separator

COMMUNICATING LAYERED TANKS

Thanks to their intelligent measurements, Froling layered tanks can be easily installed in the boiler room. And in rooms with low ceilings, Froling offers even more.

Up to four short slim tanks can be joined together with exact temperature layering in all tanks. Another advantage is the fast and easy assembly with the tanks just 80 mm apart.

Serial linking

Layered tanks are expanded by connecting layered tanks in series, partly because it is possible to connect layered tanks of different sizes and partly because large distances or obstacles can be overcome. It is also possible to connect a solar system at any time with this option.

Tichelmann connection

Several layered tanks can also be linked according to the Tichelmann principle. With this type of connection, an optimally regulated system is required to guarantee uniform loading and emptying of all layered tanks.

EFFICIENT SYSTEMS FOR ALL REQUIREMENTS

With its range of storage tank systems, Froling offers the ideal solution for almost any situation. Froling layered tanks make intelligent heating management and optimum heating support possible. If a solar system is to be built in, the Froling solar layered tank, H3 hygienic solar layered tank and FW modular solar layered tank are ideal.

The Unicell NT-S ensures efficient domestic hot water heating, using solar energy if desired. Furthermore, Froling offers compact comprehensive solutions for the boiler room thanks to its hygienic layered tank with integrated domestic hot water element and modular layered tank with fresh water module.

LAYERED TANKS / SOLAR LAYERED TANKS

The ingenuity is in the detail! Froling's layered tanks and solar layered tanks feature an impressive heat management concept, with optimal energy intake and withdrawal.

Froling's solar layered tank also makes it easy to integrate solar power. The tried and tested layer separator system ensures optimum use of solar energy and heating support.

High-quality insulation (100 mm) Neopor and fleece

The high-performance insulation with an outer jacket ensures optimum thermal insulation and low radiant heat loss, resulting in maximum efficiency.

- Advantages:
- Best thermal insulation
 - Low radiant heat losses
 - Compliant with fire protection class B2

Tried and tested layer separator system

The tried and tested layer separator system ensures exact temperature layering in the tank, guaranteeing you an ideal energy yield and increased flow rate.

- Advantages:
- Maximum energy yield
 - High flow rate

High-performance solar element (only solar layered tanks)

The high-performance solar element ensures that the tank is loaded to full capacity when energy is available from the solar panel system. In case of lack of sun and low temperatures in the solar panel system, these low temperatures are layered at the bottom of the tank resulting in pre-heating of the cold area.

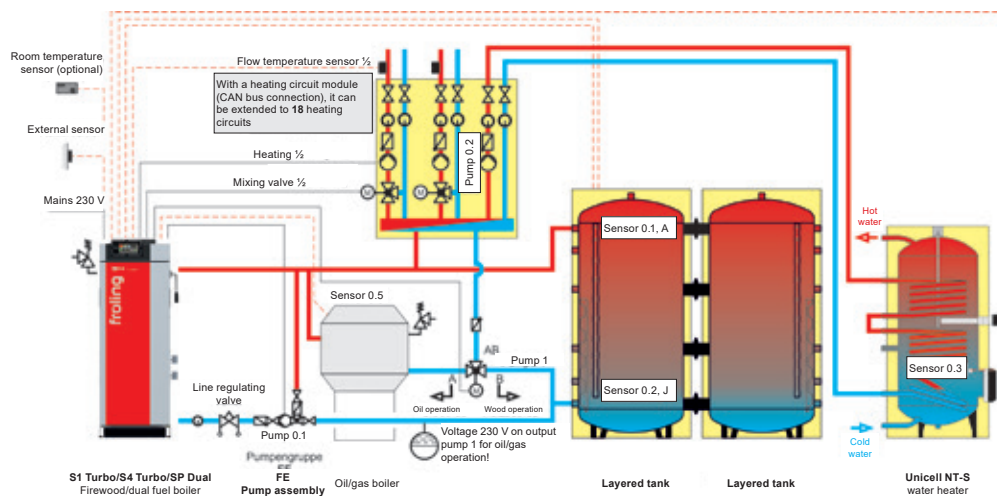

- Advantages:
- Perfect integration of solar energy

CONNECTION EXAMPLES

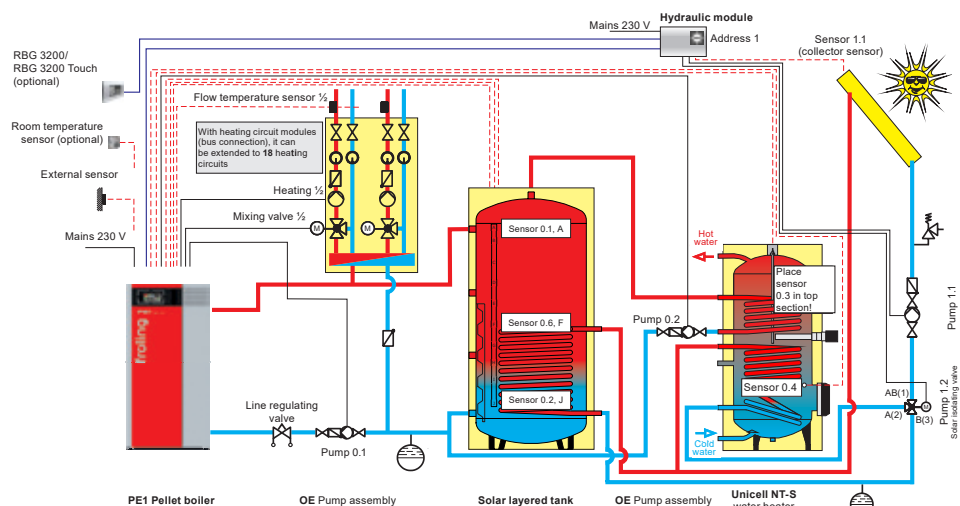

T4e with layered tank and Unicell water heater

H2 HYGIENIC LAYERED TANK / H3 HYGIENIC SOLAR LAYERED TANK

Froling's hygienic tanks combine a layered tank and hot water tank all in one. The volume of the storage tank is large, yet the capacity of the high-performance stainless steel corrugated pipe element is relatively low. Thanks to the highly efficient heat exchanger surface area, the tank provides consistently sufficient fresh hot water of exceptional quality using the flow principle. Guaranteed to be free from legionella bacteria.

Two additional high-performance solar elements permit efficient integration of solar energy in combination with the H3 hygienic solar layered tank. The corrugated stainless steel hot water pipe element which runs through the tank optimally cools the bottom part of the tank by preheating the domestic hot water. The low temperatures at the bottom of the tank enable a low return feed temperature to the collector and thus extremely efficient utilisation of the solar energy irradiation (up to 70% more energy yield depending on the collector type).

High-quality insulation (100 mm)

The high-performance insulation with an outer jacket ensures optimum thermal insulation and low radiant heat loss, resulting in maximum efficiency.

Advantages:

- Best thermal insulation
- Low radiant heat losses
- Compliant with fire protection class B2

Two high-performance solar elements (only H3 hygienic solar layered tank)

The upper solar element ensures rapid heating of the tank in the hot water area and provides solar energy for heating the domestic hot water. The lower element ensures that the tank is loaded to full capacity when energy is available from the solar panel system. In case of lack of sun and low temperatures in the solar panel system, these low temperatures are layered at the bottom of the tank resulting in pre-heating of the cold area.

Advantages:

- Perfect integration of solar energy
- Optimal energy yield

Stainless steel corrugated pipe element

The stainless steel corrugated pipe element provides fresh hot water free from legionella using the flow principle. The internal movement means that there is hardly any depositing, even in very hard water areas.

Advantages:

- Fresh water guaranteed free from legionella

Tried and tested temperature control system

The tried and tested temperature control system ensures exact temperature layering in the tank, guaranteeing you an ideal energy yield and increased flow rate.

Advantages:

- Maximum energy yield
- High flow rate

FROLING MODULAR LAYERED TANK / FW MODULAR SOLAR LAYERED TANK

Froling's FW layered tank and new FWM fresh water module are a complete compact solution for the boiler room. The layered tank is available with or without a solar element. They can be used in combination with the full range of Froling tanks to offer optimal solutions for almost any area of use.

The high-performance solar element ensures that the tank is loaded to full capacity when energy is available from the solar panel system. Thanks to the specially-developed temperature control system TCS, the tank enjoys optimum layering thereby resulting in increased flow rate as a result of the constant hot water areas.

High-quality insulation (100 mm)

The high-performance insulation with an outer jacket ensures optimum thermal insulation and low radiant heat loss, resulting in maximum efficiency.

Advantages:

- Best thermal insulation
- Low radiant heat losses
- Compliant with fire protection class B2

Temperature control system TCS

The specially-developed temperature control system TCS ensures optimal temperature layering in the tank. The layered hot water areas ensure high flow rates. The incoming flow of water is decelerated by the temperature control system TCS which results in exact layering. This then leads to constant layering in the hot water areas, resulting in less (primary) energy being used to warm the tank. It also means that lower storage volumes and fewer solar collector areas (in the case of the modular solar layered tank) are required for the hot water supply. The temperature control system TCS ensures optimum energy yield.

Advantages:

- Maximum energy yield
- High flow rate

High-performance solar element (only modular solar layered tanks)

The solar element ensures rapid heating of the tank in the hot water area and provides solar energy for heating the domestic hot water. The solar element ensures that the tank is loaded to full capacity or for pre-heating the cold area when energy is available from the solar panel system.

Advantages:

- Perfect integration of solar energy
- Optimal energy yield

Fresh water module FWM (30 - 40 litres) for direct installation on tank

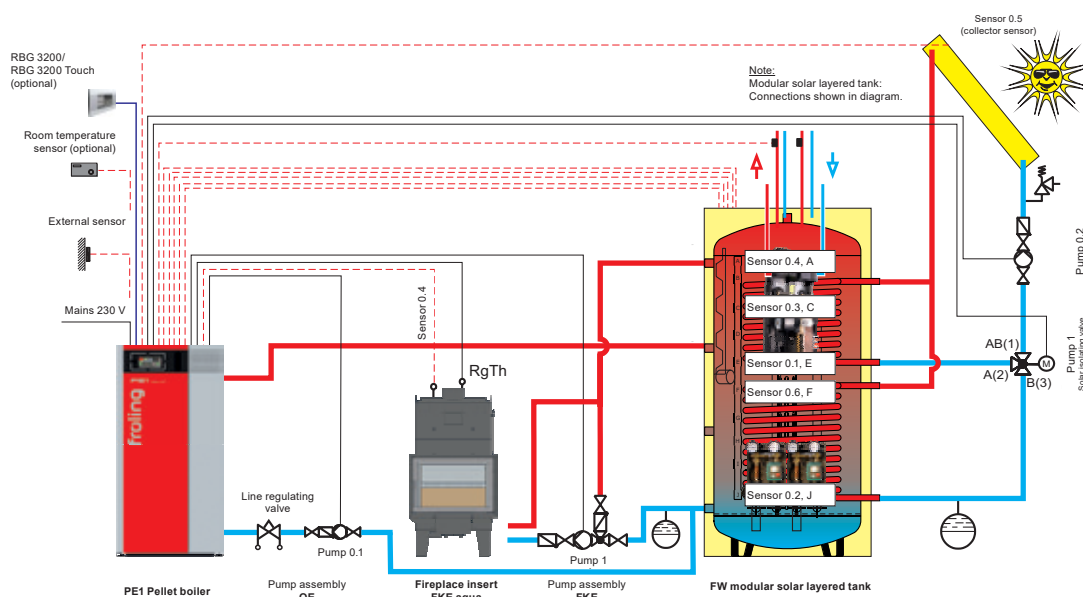

The Froling fresh water module FWM provides constant fresh, hygienic hot water and shows very little loss. According to the flow principle, water coming out of the layered tank is passed through the plate heat exchanger (soldered using copper and stainless steel) and heated until it reaches the predefined hot water temperature. The thermostat ensures the flow temperature in the heat exchanger is set which results in reduced levels of scale formation caused by heat.

Fresh water station FWS (40 - 100 litres) for wall mounting

The fresh water station FWS with integrated electronic controller delivers DHW heating according to the instantaneous water heater principle (DVGW, worksheet W551) by means of a plate heat exchanger made of high-quality stainless steel, and therefore offers a hygienic and convenient solution for the supply of domestic hot water. The continuous flow principle also prevents the risk of legionella build-up.

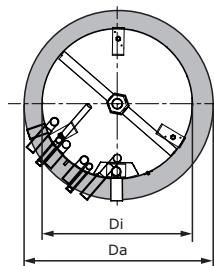

PE1 Pellet with additional boiler and FW modular solar layered tank

UNICELL NT-S HOT WATER TANK

Much energy can be saved not only during heating but also during hot water preparation. In this respect Froling and the Unicell are forging new paths. The vacuum enamelling and magnesium protection anode protect against corrosion and ensure resistance to high temperatures and a long life cycle. Whether it's an optimal hot water preparation system for every heat boiler or an efficient solar tank, the Froling Unicell is fully versatile and guarantees efficient, hygienic hot water preparation.

The Froling Unicell NT-S permits efficient use of solar energy to heat domestic water. The lower element is connected directly to the solar panel system. The upper heating surface provides extra heat, meaning that the solar energy can be used all year round. It is also possible to provide extra heating using an electric heating cartridge, available separately.

High-quality insulation (50 mm)

The high-performance insulation with an outer jacket ensures optimum thermal insulation and low radiant heat loss, resulting in maximum efficiency.

- Advantages:
- Best thermal insulation
 - Low radiant heat losses

Large heat exchanger surface areas

When in use as a solar tank, the large lower heating surface is connected to the solar panel system. The upper heating surface provides extra heat, meaning that the solar energy can be used optimally all year round.

When using with a boiler alone, both coils are connected directly to the boiler. The resulting heat exchanger surface area ensures a short loading time and high operating comfort.

- Advantages:
- Maximum energy yield
 - Optimum use of solar energy

Connection for electric heating cartridge

When being used as a solar tank, you can provide additional heating with an electric heating cartridge, available separately.

Large cleaning flange

- Advantages:
- Complete water drainage
 - Easy cleaning
